Cloud infrastructure

How do you benefit from a German cloud provider? With the DTS cloud infrastructure, we offer you a flexible and freely scalable cloud infrastructure in several certified German data centers. Your data is safe and GDPR-compliant at all times there. You purchase computing power, storage, network and security resources on demand and only pay for what you use. Thanks to the flexible scalability of each virtual machine, you also avoid unnecessary costs and always get the right performance.

- Rent IT resources flexibly & save costs
- 24/7 operation
- Consulting, provisioning & migration
- GDPR-compliant solution in our own German certified data centers
- Proactive monitoring & incident handling
- Based on proven VMware technology
- High security through a strong partner: Palo Alto Networks

The service includes, for example, the following products: virtual servers, managed virtual servers, managed databases, managed Kubernetes, object storage through to high performance storage, managed load balancers, etc. Multiple German sites and site-to-site connections also allow applications and data to be kept with geo-redundancy, thereby increasing their availability.

And of course: everything is always on. No matter which platform you use, it is 99.98% available and, in addition to redundant connectivity, is serviced around the clock by active support teams. You can rest assured that your resources will be available to you at all times.

Our premium service is only made possible with premium components. With the DTS cloud, you make use of reputable manufacturers such as VMware, HP Enterprise, Intel, Nvidia, Palo Alto Networks and Juniper, as well as our own certified data centers in Germany. Your personal German and English-speaking support and the managed services you require of us relieve the burden on your IT teams and allow you to focus on your core business. Managed services offer important added value in services, with a selection of e.g. patch management for the operating systems (Windows and Linux), backup, monitoring, vulnerability scans, endpoint protection and much more.

We are a multi-cloud service provider and offer you consulting, setup and operation of a flexible public cloud infrastructure that can be scaled as required in AWS, Azure and GCP. It is also possible to connect the DTS cloud and public clouds with each other as part of a multi-cloud strategy to provide a multi-cloud infrastructure.
