CYBER SECURITY ASSET MANAGEMENT SERVICE

CYBER SECURITY ASSET MANAGEMENT SERVICE

These are often underestimated challenges in IT security: shadow IT, abandoned cloud instances, unknown SaaS access points, uninventoried endpoints, and security tools with entirely different views of assets. While various standalone solutions perform comprehensive vulnerability scans or monitor endpoints, the problems mentioned above usually remain undetected and are therefore not subject to security controls. The crucial question is: Which assets actually exist and do they consistently meet the defined security requirements? This is precisely where the DTS Cyber Security Asset Management Service comes in, specifically addressing this vulnerability to significantly reduce your exposure and substantially increase your security level.

See it. Know it. Secure it!

- Complete asset visibility: comprehensive inventory of all IT and security assets
- "Single Source of Truth": consolidation of all data sources into a consistent overview on a central platform
- Automated data processing: correlation, deduplication and structuring of all asset information
- Continuous compliance auditing, elimination of shadow IT and enforcement of policies throughout the entire asset lifecycle
- Real-time asset management: ongoing inventory, status monitoring and control
- Integrated analysis and automation: dashboards, reporting and optimization of operational processes
- Review and validation of existing IT security measures, as well as identification of gaps
- Provided from German, certified DTS data centers, including 9x5 support
- Combination with Exposure Management: Asset visibility & risk based vulnerability detection as a "dream team"

TURNING CHAOS INTO CLARITY

Our solution captures a comprehensive inventory of an organization's entire IT and security assets, including hosts, cloud instances, containers, users, licenses, IoT/OT and much more. Data from over 900 system-, cloud-, network-, and security-sources are automatically consolidated into a "single source of truth" for the entire attack surface. The collected asset discovery data is correlated, deduplicated, and processed, resulting in a centralized overview on a unified platform. We eliminate the need for incomplete information from individual, solution-specific management interfaces. The resulting visibility and associated processing capabilities then enable, for example, continuous compliance checks, the elimination of shadow IT and the automation of operational processes. Reports also provide additional transparency and control options.

ONE PLATFORM. ALL ASSETS. FULL CONTROL.

Centralized and continuous asset inventory management, including policy enforcement, real-time consolidation of asset data from a wide range of existing systems, detailed asset status, validation of security measures and configurations, identification of tool gaps or simply comprehensive compliance transparency – e.g., to meet NIS-2 guidelines – the service enables all of this in a single solution. A dedicated Customer Success Manager also supports you in implementing relevant use cases and continuously optimizing them through regular reviews. At DTS, we provide clear visibility into increasingly complex IT and OT landscapes. We deliver the platform via a co-managed model from our German, certified DTS data centers, complete with 9x5 support.

EXEMPLARY USE CASES

- Reconciliation of various data sources, merging of duplicates, data normalization
- Recording of all assets, e.g., for more efficient lifecycle management or for NIS-2 compliance
- **Single Source of Truth: complete view of assets across all systems**

- Define individual security policies
- Automatically detect deviations
- Reporting for e.g., audits/ISO 27001/NIS-2
- **Elimination of shadow IT**

- Completeness checks during the rollout of AV/EDR/XDR agents to ensure functional communication, active notifications regarding the availability of critical security patches, identification of user accounts without passwords, etc.
 - **Detection of tool gaps**

 - **Transparency platform & control authority**
 - **Data consolidator & governance enabler**
- ...for complex IT environments**

BUNDLE WITH DTS EXPOSURE MANAGEMENT

We go several steps beyond the "standard" to provide you with unique added value. One such USP is the combination of DTS Cyber Security Asset Management with DTS Exposure Management. These solutions combine complete asset transparency with precise vulnerability analysis. Security vulnerabilities are automatically assigned to the correct systems and prioritized in context. This enables companies to identify risks faster, take targeted action and strengthen their IT security in the long term. Integrating Exposure Management thus provides a comprehensive overview. Cyber Security Asset Management shows where specific assets are located, their current condition and whether they are insured. Exposure Management identifies where a fire could break out soon or has already started and determines the appropriate prioritization to ensure true resilience.
