EXPOSURE MANAGEMENT

EXPOSURE MANAGEMENT

In today's threat landscape, security vulnerabilities are automatically detected and exploited within seconds. Reality also reveals just how vast the attack surface truly is: modern, large-scale IT environments contain an average of 11,000 vulnerabilities and numerous exposed systems, many of which remain undetected for long periods or are incorrectly prioritized. As a result, regulatory requirements are becoming increasingly stringent and demand explicit and continuous Vulnerability Management. Our Exposure Management addresses precisely these challenges. It goes far beyond traditional Vulnerability Management and focuses on the entire network perimeter—that is, every area through which systems and applications are accessible. Instead of focusing solely on individual vulnerabilities, our approach specifically analyzes all access points using automated external attack surface management. This gives you a comprehensive overview of potential risks and enables you to detect threats early, prioritize them effectively, and mitigate them efficiently.

Our platform is a European solution that meets the highest data protection standards and is delivered entirely from a European cloud. It specifically supports companies in meeting regulatory requirements such as NIS2 and other compliance obligations.

AT A GLANCE

- Full transparency of your attack surface through identification of all assets, including unknown
- Comprehensive vulnerability coverage through protection of systems, networks, cloud, APIs, IoT and users
- AI-powered analysis for intelligent prioritization of risks based on real threats and business impact
- Automated continuous security through ongoing scans, monitoring and assessments
- Central platform with all security-relevant information consolidated in a unified interface
- European solution from an EU cloud environment with compliance to the highest data protection standards
- Exposure & Patch management as a bundle option for automated and controlled risk reduction
- DTS Managed Service

COMPREHENSIVE UNDERSTANDING

Our platform establishes a comprehensive security risk management system that provides organizations with complete transparency and control over their entire attack surface. Instead of isolated, one-time scans, it creates a continuous, holistic process that integrates all steps of modern cyber defense: from identification and assessment to prioritization and targeted remediation of security risks. All assets, both internal systems and externally exposed components - are automatically detected and continuously monitored. This combines traditional vulnerability analysis with integrated management of the external attack surface, revealing previously unknown or inadequately documented attack surfaces. By linking to current threat intelligence, the assessment is not conducted in isolation but within the context of real threats. This means: You not only identify vulnerabilities but also pinpoint exactly which ones actually endanger your business. Based on this, the platform prioritizes threats according to their risk and provides concrete, actionable recommendations. The result is clear decision-making criteria, structured processes and a reduction in your cyber risks, instead of long and hard-to-prioritize lists of vulnerabilities.

CLOSED SECURITY CYCLE

The innovative combination of Exposure and Patch Management enables a holistic approach to managing enterprise risks. While Exposure Management identifies security vulnerabilities, our Patch Management ensures their automated and controlled remediation. Risks are identified, prioritized and consistently resolved. The agent-based approach simplifies the identification and distribution of patches and allows maintenance windows, reboots and update rules to be defined individually for each system. Multi-stage rollout cycles also reduce the risk of errors, particularly for sensitive systems. This is complemented by a comprehensive application catalog, automated maintenance for servers and clients, flexible rules such as whitelisting and blacklisting, as well as comprehensive support and the implementation of defined remediation concepts by DTS experts.

DTS MANAGED SERVICE

To ensure that Exposure Management does not place an additional burden on the IT team, our platform is complemented by appropriate DTS Managed Service options, such as platform deployment and maintenance, first- and second-level support (5x9), and best practices for classifying asset criticality.
