

DTS MANAGED OPEN VM/PLATFORM

The pressure on companies is mounting. They must operate their IT systems cost-effectively amid rapidly rising hardware costs while maintaining control over data, platforms and technological decisions. Not to mention the constant pressure to stay up-to-date technologically and remain competitive. With DTS Managed Open VM/Platform, we provide you with a powerful, highly available and European open-source infrastructure. You strengthen your data sovereignty and vendor independence while benefiting from predictable costs.

DTS MANAGED OPEN VM

Virtual systems require a stable foundation. This is exactly where DTS Managed Open VM comes in. The shared platform is based on clustered nodes and views virtualization as the cornerstone of state-of-the-art IT. We provide you with high-performance, highly available and flexibly scalable environments for stable business processes.

The monthly costs for your VMs already include all licenses required for operation as well as platform maintenance costs. This allows you to use VMs without complexity and with protection against unexpected additional costs. You also increase your digital sovereignty. The underlying platform is based on European open-source software and your data is processed in compliance with the GDPR in certified DTS data centers in Germany. This reduces your dependence on non-European providers while simultaneously creating a robust foundation for future-proof IT strategies.

DTS MANAGED OPEN PLATFORM

With the DTS Managed Open Platform, we provide you with a foundation for modern IT that is tailored to your company and not to the roadmaps of individual vendors. On-premises operation combines high availability, flexible scalability and efficient resource utilization with a clear focus on openness and long-term investment security.

Instead of locking yourself into proprietary structures, you have the option to continue using existing hardware and enjoy a high degree of architectural freedom. Your environment remains adaptable, effective and economically viable in the long term.

DTS takes over the management of the provided or existing environment, as well as monitoring and maintenance. This frees up internal resources and ensures reliable operation through the specialized expertise of our experts.

AT A GLANCE

- Strengthen data sovereignty through a European software foundation and GDPR-compliant data storage in certified German data centers
- Reduce cost pressures with predictable monthly expenses
- Reduce vendor lock-in and regain control over technology decisions
- Ensure high availability through a clustered architecture
