Wombat - Security Awareness Training

Wombat

As more than 90% of all cyber-attacks begin with email, the security of your data depends on careful end users. While current solutions include technologies to detect and block malicious email, you can further reduce phishing or ransomware attacks yourself through effective threat simulations and training.

Our Wombat solution from Proofpoint increases security awareness and changes user behaviour. This reduces the risk of cyber attacks and prevents data breaches.

- optimization of user behaviour
- risk reduction from phishing and other cyber attacks
- prioritisation and improvement of incident response
- unlimited use of platform
- multilingual support
- real-time reporting
- prevention of data protection violations

Evaluation

Use **ThreatSim** phishing simulations to find out which employees are vulnerable to phishing and Spear phishing attacks. You'll receive more than 500 different phishing templates in 30 languages and 13 categories. You can also assess users against multiple threats, such as malicious attachments or embedded links.

Cyberstrength is a powerful web-based survey tool that uses existing or proprietary questions to identify areas where your employees are vulnerable to attack. You do not need to run a simulated attack to do this.

Training

Use more than 35 different hands-on topic modules to train your employees in the respective areas in order to detect and prevent numerous different phishing and other cyber-attacks. The training modules are available on demand and each module can be completed in 5 to 15 minutes to minimize disruption of daily work.

Reduction

The **PhishAlarm** email client add-in is included with **ThreatSim** so your employees can report suspicious messages with one click.

PhishAlarm Analyzer prioritises reported messages and improves incident response. It allows administrators to quickly review important details and help you make decisions and take action.

Reporting

The results of the training courses and phishing simulations can be evaluated in detail. It is also possible to make the data anonymous.

With its unique method, Wombat offers a continuous training opportunity. The method, which forms a repetitive cycle of assessment, training, reduction and evaluation, has been proven to reduce phishing and cyber-attacks.
